

Inhaltsverzeichnis

1	Foreword
2	Safety and Reliability in Signalling Systems
2.1	Safety Basics
2.1.1	What is RAMS(S)?
2.1.2	Safety/Security
2.1.3	Availability, Reliability and Maintainability
2.1.4	Role of the RAMS Components in the Railway System
2.2	Safety Principles in Railway Operation
2.2.1	Dealing with Errors, Failures and Disturbances (E/F/D)
2.2.2	Analysis of E/F/D by System States
2.3	Conception of Safety and Reliability of Railway Automatic Systems
2.4	Characteristics of Reliability and Safety
2.5	Evaluation of Safety Level of RACS
2.6	Rating of Safety Parameters
2.7	Calculations of the Safety Parameters
2.8	Methodology of Safety Evidence for RACS
3	Railway Operation Processes
3.1	Historical Background
3.2	Classification of Tracks, Stations and Signals
3.2.1	Main Tracks and Secondary Tracks
3.2.2	The Role of Signals
3.2.3	Definitions of Stations and Interlocking Areas
3.2.4	Signal Arrangement on Double Track Lines
3.3	Movements with Railway Vehicles
3.3.1	Train Movements
3.3.2	Shunting Movements
3.4	Principles of Train Separation
3.4.1	Signalled Fixed Block Operation
3.4.2	Cab Signal Operation
3.4.3	Non Signal-controlled Operation
3.5	Dispatching Principles
3.5.1	Decentralised Operation
3.5.2	Centralised Traffic Control
4	Interlocking Principles
4.1	Overview
4.1.1	Introduction
4.1.2	Basic Requirements
4.1.3	Basic Principles of Safeguarding a Train's Path
4.2	Element Dependences
4.2.1	Classification
4.2.2	Coupled Elements

- 4.2.3 Undirectional Locking
- 4.2.4 Simple Bidirectional Locking
- 4.2.5 Conditional Bidirectional Locking
- 4.3 Routes**
- 4.3.1 Introduction
- 4.3.2 Extension of Routes and Related Speed Restrictions
- 4.3.3 Basic Route Locking
- 4.3.4 Route Selection by the Signaller
- 4.3.5 Flank Protection
- 4.3.6 Overlaps and Front Protection
- 4.3.7 Route Elements in the Start Zone
- 4.3.8 Life Cycle of Routes
- 4.3.9 Principles of Route Formation in the Track Layout
- 4.3.10 Shunting Routes
- 4.3.11 Automation of Route Operation
- 4.4 Block Dependences**
- 4.4.1 Introduction
- 4.4.2 Geographical Assignment of Block Sections
- 4.4.3 Classification of Block Systems
- 4.4.4 Process of Block Working in Token Block Systems
- 4.4.5 Process of Block Working in Tokenless Block Systems
- 4.4.6 Locking Functions of Tokenless Block Systems
- 4.4.7 Returning Movements
- 4.5 Special Issues**
- 4.5.1 Overlaying Block and Route Interlocking Systems
- 4.5.2 Protection of Trains by a Signal at Stop in Rear
- 4.5.3 Several Trains between two Signals
- 4.5.4 Degraded Mode Operation

- 5 Detection**
- 5.1 Requirements and Methods of Detection**
- 5.1.1 Introduction
- 5.1.2 Types of Objects
- 5.1.3 Safety Requirements
- 5.1.4 Detection Purposes
- 5.2 Technical Means of Detection**
- 5.2.1 Classification
- 5.2.2 Spot Wheel Detectors
- 5.2.3 Linear Wheel and Axle Detectors
- 5.2.4 Linear and Area Detectors for Vehicles and External Objects
- 5.2.5 Three-Dimensional Detection
- 5.2.6 Systems with Active Reporting from the Train
- 5.2.7 End of Train (EOT) Detection Systems
- 5.3 Track Circuits**
- 5.3.1 Basic Structure of Track Circuits
- 5.3.2 Geometrical Assembly of Track Circuits
- 5.3.3 Treatment of Traction Return Currents
- 5.3.4 Additional Functions of Track Circuits
- 5.3.5 Immunity against Foreign Currents

- 5.3.6 Electrical Parameters and Dimensioning
- 5.3.7 Application of the Types of Track Circuits
- 5.4 Axle Counters**
- 5.4.1 General Structure and Functioning
- 5.4.2 The Rail Contact
- 5.4.3 Treatment of Counting Errors
- 5.5 Comparison of Track Circuits and Axle Counters**
- 5.5.1 Advantages and Disadvantages
- 5.5.2 Application

6 Movable Track Element

- 6.1 Kinds of Movable Track Elements and their Geometry**
- 6.1.1 Overview
- 6.1.2 Simple Points
- 6.1.3 Other Solutions for Connection of Tracks
- 6.1.4 Arrangements of Several Movable Track Elements
- 6.1.5 Derailing Devices
- 6.2 Safety Requirements at Movable Track Elements**
- 6.3 Track Clear Detection at Points and Crossings**
- 6.4 Point Machines**
- 6.4.1 Overview
- 6.4.2 Electric Point Machines
- 6.4.3 Supervision of Point Position on the Example of SP-6
- 6.5 Point Locking Mechanisms**
- 6.5.1 External Locking Mechanism: Clamp Lock
- 6.5.2 Internal Locking Mechanism
- 6.5.3 Monitoring of Locking Mechanism
- 6.5.4 Mechanical Key Lock
- 6.6 Circuitry of Point Operation and Control in Relay Technology**
- 6.6.1 General Overview
- 6.6.2 Example with Type N Relays: Russian Five-Wire Point Circuitry
- 6.6.3 Example with Type C Relays: GS II DR (Germany)

7 Signals

- 7.1 Requirements and Basic Classification**
- 7.2 Technical Characteristics of Trackside Signals**
- 7.2.1 Structure of Light Signals
- 7.2.2 Optical Parameters
- 7.2.3 Retro-Reflection of Passive Signal Boards
- 7.2.4 Control and Supervision of Signal Lamps
- 7.3 Principles of Signalling by Light Signals**
- 7.3.1 Utilisation of Signal Colours
- 7.3.2 Stop Aspects
- 7.3.3 Signalling of Movement Authorities
- 7.3.4 Signalling of Speed Reduction
- 7.3.5 Combination of Main and Distant Signals
- 7.3.6 Shunting Signals
- 7.4 Redundancy and Degraded Mode Operation**
- 7.5 Signal System Examples**

- 7.5.1 German Mechanical and “H/V” Light Signals
- 7.5.2 Belgian Mechanical Signals
- 7.5.3 British Light Signals
- 7.5.4 OSZD Signals
- 7.5.5 Modern Dutch Signal System
- 7.5.6 German System “Ks”
- 7.5.7 Signal System on Japanese Commuter Lines
- 7.5.8 NORAC Signals

8 Train Protection

8.1 Requirements, Classification and Conditions for Application

- 8.1.1 General Overview
- 8.1.2 Cab Signalling Functions
- 8.1.3 Supervision Functions
- 8.1.4 Intervention Functions
- 8.1.5 Role in the Railway Operation Process
- 8.1.6 Automation of Train Operation

8.2 Technical Solutions for Data Transmission

- 8.2.1 Overview over Forms of Transmission
- 8.2.2 Spot Transmission
- 8.2.3 Linear Transmission

8.3 Particular Systems

- 8.3.1 Classification of Systems
- 8.3.2 Group 1: Systems with Intermittent Transmission and without Braking Supervision
- 8.3.3 Group 2: Systems with Intermittent Transmission at Low Data Volume and with Braking Supervision
- 8.3.4 Group 3: Systems with Continuous Transmission of Signal Aspects by Coded Track Circuits
- 8.3.5 Group 4: Systems with Intermittent Transmission at High Data Volume and Dynamic Speed Supervision
- 8.3.6 Group 5: Systems with Continuous Transmission at High Volume and Dynamic Speed Supervision

8.4 ETCS

- 8.4.1 History + Motivation
- 8.4.2 Application Levels and Technical Components
- 8.4.3 Functional Concepts
- 8.4.4 Operation Modes

9 Interlocking Machines

9.1 Classification

9.2 Mechanical Interlocking

- 9.2.1 Historical Development
- 9.2.2 System Safety in Mechanical Interlocking
- 9.2.3 Structure of Mechanical Interlocking Systems
- 9.2.4 Example: British Origin Mechanical Interlocking
- 9.2.5 Example: German Type “Einheit”

9.3 Relay Interlocking

- 9.3.1 Historical Development

- 9.3.2 System Safety in Relay Interlocking
- 9.3.3 Design of Relay Interlocking Systems
- 9.3.4 Example: SGE 1958 (Britain)
- 9.3.5 Example: SpDrS60 (Germany)
- 9.3.6 Example: UBRI (Russia)
- 9.4 Electronic Interlocking**
- 9.4.1 Historical Development
- 9.4.2 System Safety in Electronic Interlocking
- 9.4.3 Structure of Electronic Interlocking Systems
- 9.4.4 SSI (Britain)
- 9.4.5 SMILE (Japan)
- 9.4.6 SIMIS and L90 with Derivates (German origin)
- 9.4.7 Ebilock
- 9.4.8 EC-EM (Russia)
- 9.4.9 ACC (Italy)
- 9.4.10 Local-electrical Operated Point Switches (LOPS)
- 9.5 Hybrid Technologies**
- 9.5.1 Hybrid Mechanical and Electrical/Pneumatic/Hydraulic Forms
- 9.5.2 Hybrid Relay and Electronic Forms

10 Line Block Systems

- 10.1 Classification**
- 10.2 Safety Overlays for Staff Responsible Safety Systems**
- 10.3 Decentralised Block Systems**
- 10.3.1 Overview
- 10.3.2 Token Block Systems
- 10.3.3 Systems with Singular Unblocking upon Clearing
- 10.3.4 Systems with Continuous Unblocking
- 10.4 Centralised Systems for Safety on Open Lines**
- 10.4.1 Overview
- 10.4.2 Centralised Block Systems for Secondary Lines
- 10.4.3 Radio Electronic Token Block
- 10.4.4 Open Line Controlled from Neighbouring Interlockings
- 10.4.5 Train Control Systems for High Speed Lines
- 10.5 Moving Block Systems**

11 Remote Control and Operation Technology

- 11.1 Remote Control and Monitoring**
- 11.1.1 Types of Dispatcher Control/Monitoring
- 11.1.2 Centralisation of Interlocking Control
- 11.1.3 Flexible Allocation of Control Areas
- 11.2 Processes in Operation Control**
- 11.2.1 Information Input and its Viewing
- 11.2.2 Evaluation of Operational Situation
- 11.2.3 Command Output
- 11.3 Data Transmission in Remote Control Systems**
- 11.3.1 Types of Communication between CTC and stations
- 11.3.2 Interface between CTC and Relay Interlockings on the Relay Technology
- 11.3.3 Interface between CTC and Relay Interlockings on the Electronic Technology

- 11.4 Operator's Workload**
- 11.4.1 Influence of Technology
- 11.4.2 Influence of Size of Infrastructure
- 11.4.3 Influence of Operation Programme
- 11.4.4 Influence of Moving Vehicles
- 11.4.5 Influence of Disturbances
- 11.4.6 Results and Conclusions of Calculating Operator's Workload
- 11.5 Examples for Operation Control Systems**
- 11.5.1 Centralized Traffic Control in the USA
- 11.5.2 Operation Control Centres in Germany
- 11.5.3 Operation Control Centres in Russia

12 Safety and Control of Marshalling Yards

- 12.1 Principles of Marshalling of Trains**
- 12.2 Parts of Marshalling Yards and their Function**
- 12.2.1 General Structure and Functioning
- 12.2.2 Layout Variants
- 12.2.3 Automation
- 12.3 Control of Marshalling Yards**
- 12.3.1 Introduction
- 12.3.2 Retarders
- 12.3.3 Handling Systems for Freight Cars
- 12.3.4 Points
- 12.3.5 Sensors
- 12.3.6 Track clear Detection

13

14 Hazard Alert Systems

- 14.1 Hazards in Railway Systems**
- 14.1.1 Safety Related Hazards
- 14.1.2 Security Related Hazards
- 14.2 Solutions for Hazard Detection**
- 14.2.1 Ways of Inspection
- 14.2.2 Fault States to Monitor
- 14.2.3 New Approach of Inspection – The Checkpoint Concept
- 14.2.4 Extract of Available Technologies and Products
- 14.3 Choice of Location**
- 14.3.1 Operational Handling
- 14.3.2 Classification of Risky Elements
- 14.3.3 Strategies for Infrastructure Manager
